SUMMARY

Software engineer with **12 years** building and operating web platforms at enterprise scale. At Salesforce/Tableau I share ownership of the build, test, deployment, and reliability automation behind **tableau.com** — a top-5,400 global site at roughly 13 million monthly visits, on a ~60-module enterprise Drupal platform. I led its Google Analytics 4 (GA4) data-layer re-platform and built its public pricing calculator. I take the release rotation, lead the weekly operations review, and carry the pager.

EXPERIENCE

Salesforce / Tableau — Software Engineer (MTS), Marketing Engineering

Oct 2021 – Present · Seattle, WA (Remote)

Marketing Engineering for tableau.com: a top-5,400 global site at ~13M monthly visits, on Drupal 10 / PHP 8.3 with ~58 custom modules, ~3,500 configuration files, and a ~100-spec Cypress end-to-end suite.

PLATFORM & INFRASTRUCTURE

- Co-own and have spent four years **streamlining an inherited CI/CD system**: five purpose-built CI container images published to a private registry, and a Docker Compose environment running the ~100-spec end-to-end suite deterministically, and **branch-scoped dependency cache keys** that eliminated a class of intermittent build failures.
- Maintain a **gated multi-environment deployment pipeline** with commit-SHA parity verification, a programmatic gate blocking production on failed upstream checks, and automated release notifications — shipping four unattended production releases per week.
- Maintain a nightly **Extract-Transform-Load (ETL) pipeline** that clones, prunes, and sanitizes production data into test and development, publishes fixtures, and provisions test users.

PRODUCT & ANALYTICS ENGINEERING

- Built the current **Tableau Pricing Calculator** (tableau.com/product-and-pricing-selector) — a React application on a Drupal REST API I designed, with multi-currency logic and exchange-rate caching server-side, negotiated payload contracts with the frontend team, an accessible responsive interface, analytics instrumentation, and end-to-end Cypress coverage.
- **Led the GA4 data-layer re-platform** — 10+ event types with custom deduplication, consent-compliant cookie management, and CRM interactions-SDK integration. Effectively every marketing conversion event measured on the property flows through it.
- **Authored the technical architecture document** for a bulk content-ingestion system processing up to 100 nodes per operation, and led implementation end to end including cross-team acceptance testing with deliberate out-of-order payloads.
- Contributing engineer on the multi-year re-platform from Drupal onto a consolidated **enterprise WordPress multisite with a decoupled Node.js frontend** — content transformation, Terraform-managed environments, GraphQL integration, and CDN phased-release cutover.

RELIABILITY & RELEASE OWNERSHIP

- Serve as **Release Engineer of record** on rotation and **lead the weekly Operations Review** — owning production deployment coordination, change-request sign-off, post-deployment triage, and stakeholder-facing reporting on site health and production errors.
- **Authored the team's on-call working agreement** — drafted, socialized, and adopted organization-wide within a quarter. Active on-call participant.
- Led real-time investigation of a production incident affecting ~3,000 users: structured log-based impact assessment, root cause traced to a missing build artifact in a gated storage bucket, resolution coordinated with release engineering.
- Onboarded a new engineer onto the platform: authored the onboarding guide and paired through their first pull requests. It became standard for subsequent hires.

Moz — Software Engineer

Jul 2016 – Jan 2017 · Seattle, WA

- Migrated portions of moz.com from CakePHP to Craft CMS with the Inbound Engineering team, and partnered with UX to translate design comps into marketing pages.
- Worked with Business Intelligence to implement page-load and event tracking via **Adobe Dynamic Tag Management (DTM) and Segment** — the start of a decade of marketing-analytics engineering that continues through the GA4 work above.

Studio Ten Four — Web Developer

Oct 2014 – Oct 2021 · Seattle, WA

Built and maintained Drupal and WordPress platforms for public-sector, university, and non-profit clients, owning the relationship from requirements through delivery.

- Inherited, supported, and maintained the Drupal platform for the **University of Hawai'i, William S. Richardson School of Law** — course database, personnel directory, events calendar, and a domain-gated content portal — and **led its eventual data migration to WordPress**.
- Built the South Seminole & North Orange County Wastewater Transmission Authority site from scratch to **WCAG 2.2** compliance, and delivered custom WordPress plugins for **King County 4Culture**.
- Introduced automated build and test pipelines to client projects, and handled database schema transformation for cross-system migrations.

SELECTED PROJECTS

The Rig

github.com/laudtetteh/the-rig · MIT · 303 commits

Open-source framework that makes AI coding agents reliable across sessions: persistent structured memory, eight enforced process workflows, a task lifecycle engine, and a git hook layer enforcing secret scanning, Conventional Commits, and issue-reference validation on every commit. Nine lifecycle hooks cover protected-path writes, commit gating, and context checkpointing. Bats test suite in continuous integration; validated on a multi-contributor production platform. Grew out of **LaudBot**, an AI-powered interactive résumé delivered across 100+ pull requests whose recurring failure modes made the architecture necessary. The Rig now runs in production on Beacon Essentials.

Beacon Essentials — production e-commerce platform

Designed, built, and maintain the platform end to end. FastAPI / Python 3.11 with async MongoDB, Next.js 14, and a mobile workspace in a Turborepo monorepo. WhatsApp deep-link checkout with Mobile Money payment integration and a traditional checkout fallback, public order tracking, and an admin dashboard for orders, inventory, media, users, and operational statistics. Amazon S3 pre-signed media pipeline, JSON Web Token (JWT) invite-based admin authentication, Docker Compose locally, and GitHub Actions continuous deployment to DigitalOcean. Over one year: 540+ commits

and 450+ pull requests, with CI-enforced linting, pytest and Vitest suites, pre-commit hooks, and secret scanning on every commit.

MethodistCRM — production Laravel/MySQL CRM

Designed, built, deployed, and maintain a customer relationship management platform for community-based church programs: authentication, reporting with dynamic search, notifications, analytics, messaging, events calendar, branch locator, and a complete store, cart, and checkout flow, backed by REST APIs and S3 media storage. Also wrote its shell-based backup tooling.

SKILLS

PLATFORM & CI/CD	GitHub Actions · Docker · Docker Compose · container registries · CI/CD architecture · release engineering · deployment automation · developer experience · Bash/shell scripting
CLOUD & DELIVERY	AWS (S3, IAM, CloudFront) · Akamai CDN · Pantheon · DigitalOcean · Brotli compression
OBSERVABILITY	New Relic · Splunk · service level objectives · incident response · on-call · runbooks · root cause analysis
BACKEND & DATA	PHP · Drupal 10 · Laravel · MySQL · MariaDB · REST API design · data modeling · ETL pipelines
WEB & ANALYTICS	JavaScript · React · WordPress multisite · content migration · Google Analytics 4 · data layer engineering · Google Tag Manager · Twig · SCSS · Tailwind CSS · accessibility (WCAG)
TESTING & QUALITY	Cypress · PHPUnit · ESLint · gitleaks secret scanning

EDUCATION

BA, Business Administration

Central University College · Accra, Ghana · 2008
